

Part 02

1. What is copy constructor?

- A copy constructor is a constructor that creates a new object by copying the values of an existing object of the same type. It is used to initialize a new object with the same data as another object.

2. What is Indexer, when used, as business mention cases u have to utilize it?

- An indexer is a C# feature that allows an object to be accessed like an array using an index ([]). It is used when a class or struct contains a collection of data and you want to access its elements easily. Business examples include accessing products in an inventory system, customers in a customer list, or employees in an employee management system.

3. Summarize keywords we have learnt last lecture

- Struct,
- class,
- constructor,
- copy constructor
- access modifiers,
- public,
- private,
- protected,
- internal,
- parameter less
- override,
- overload,
- ToString(),
